Two pelvic abcesses are identified, one anterior to the uterus (turquoise asterisk) and one posterior (yellow asterisk). The iliac vein (turquoise) and inferior epigastric artery (yellow) interfere with approach of the posterior abcess (dotted).

**CASE DESCRIPTION**

In this case, Gangi-SoftGuard® was used for drainage of two pelvic abcesses.

The use of Gangi-SoftGuard® and its spring-loaded blunt tip stylet made it possible to safely pass the needle close to the iliac vein and epigastric artery, and the drains could be placed in good position.
Gangi-SoftGuard® is used to approach the abcess with the blunt tip exposed. The blunt tip allows for safe advancement avoiding of puncture of the artery and vein.
Guidewire is inserted through the Gangi-SoftGuard® needle.

The two drains are in good position.
